```
The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaccutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and

Brugger R, Lehmann M, Wyss M;

WPI; 2000-099429/09. N-PSDB; AAZ59642. New stabilized enzyme formulation, useful for feed compositions for monogastric animals

Example 4; Fig 17; 101pp; English.

The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate formulation, comprising phytase (myo-inositol hexakisphosphate formulation) and one or more stabilising agents including to phosphohydrolase) and one or more stabilising agents including for phosphohydrolase) and social carboxymethylosing with a molecular weight of 600 cy 4000 Da, preferrably 1000 to 3550 Da; the disodium salts of malonic, to 4000 Da, preferrably carboxymethylosilulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal companies to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional cy value of plant material without the need for adding additional phosphate could be considered from phytase phosphorus using the cauched by adding phytase to animal feed, as the animal can make use of thermostability and can therefore remain stable during long-term storage and may the man make use of thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a consensus sequence, designated phytase-10, which was derived from the mature phytase sequences from a variety of fungi (AAY69544-Y69554, AAY69564) and the Basidiomycetes phytase consensus AAY69563 and additionally contains the Aspergillus terreus obsilé.46 signal peptide at the N-terminus.

This sequence represents the consensus phytase-10-thermo(3)-050T-K91A. The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;

The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate observage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to creduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                       Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SAISPDVPKGCRVTFVQVLSRHGARYPTSSKSKKYSALIEAIQKNATAFKGKYAFLKTYN 120

The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including xylitol or ribitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "Phytase signal peptide from Aspergillus terreus cbs16.46"
                                                                                                                                                                                                         Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus; phosphate availibility; consensus; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New stabilized enzyme formulation, useful for feed compositions for

teed in the form of phytate phosphorus, monogastric animals are unable to tuilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved the inorganic phosphate liberated from phytate phosphorus using the and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a mutant phytase-10 consensus sequence, phytase-10-thermo[3]-050T-K91A, which has a temperature optimum and melting point 4 degrees Celsius higher than that of phytase-10 (AAX69566). Its specific activity with phytate as a substrate is also strongly increased.

increased thermosteability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate and phytases and/or for the phytases and constitutions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                                                                                                        Novel phytases with improved properties such as temperature stability, \rho H stability and substrate specificity, for use in pharmaceuticals and

The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate cleavage pattern, substrate binding, position specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                                                                                                                                                                                                                      Phytase; mutant: thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate; food; feed; phytate; manure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             such as temperature stability, for use in pharmaceuticals and

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and evel of released phosphate. The phytases can be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       temperature stability, in pharmaceuticals and

```
The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, phymaceautical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                    Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. can be used for producing phytases with improved properties e.g. specific activity, substrate specificity, temperature profile, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -
                                                            Phytase; mutant; thermostability; mutation; mutagenesis; pH stability; temperature stability; pH profile; temperature profile; reaction rate; specific activity; substrate specificity; substrate cleavage pattern; substrate binding; position specificity; phytate degradation rate;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   87 PTSSKSKKYSALIEAIQKNATAFKGKYAFLKTYNYTLGADDLTPFGEQQMVNSGIKFYRR 146

The invention relates to a process for preparing animal feed by agglomerating feed ingradients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.
                                                                                                                                                                                                                                                                                                         Phytase; animal feed preparation; thermostable phytase; transgenic plant;

Claim 5; Fig 7a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile,

ó
specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce by phramecutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manuer, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phytase; myo-inositol hexakisphosphate phosphohydrolase; stabilisation; thermostable; animal feed; monogastric animal; phytate phosphorus;

formulation, comprising phytase (myo-inositol hexakisphosphate phospholydrolase) and one or more stabilising agents including the phospholydrolase) and one or more stabilising agents including composition to the phospholydrolase; and one or more stabilising agents including to xylitol or ribitol; polyethylene glycols with a molecular weight of 600 (cc. 4000 Da. preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and propaborus. Although a large amount of phosphate is present in animal phosphate. This form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional cc value of plant material without the need for adding additional phosphate cc to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the caryme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence remain stable during long-term storage consensus sequence, phytase-1-thermo[8]-500T-K91A, which has a consensus copingment phytase-1 (approxes Celsius higher than that con phytase-1 (approxes Celsius higher than that

Sequence

```
This invention describes a novel process for the preparation of a consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or pharmaceutical compositions. This sequence represents the consensus phytase protein used in the method of the invention.

Novel phytases with improved properties such as temperature stability,

```
ó;
                                                                               The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce harmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present
 pH stability and substrate specificity, for use in pharmaceuticals and compound foods and feeds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 SAISPDVPKGCRVTFVQVLSRHGARYPTSSKSKKYSALLEAIQKNATAFKGKYAFLKTYN 120
